Virus Alert Item

April 10, 2009

Many of you are all too aware of the recent press surrounding the Conficker virus and the fact that it is "waking up" this week. Increasing reports of actual infections are beginning to trickle in, and the worst is probably yet to come. While keeping the operating system updated and patched, and running a quality anti-virus program are the basic steps to take, many of our contacts and clients remain concerned about whether any of their systems are at risk. There are certainly tools available from many of the anti-virus vendors, but there is also a very simple and creative web based tool which takes advantage of this virus' ability to block access to anti-virus web sites. This provides a simple path to testing the presence of the Conficker virus in an immediate and visual format. We have published our version of this tool on the Kali Systems LLC website for the benefit of our clients and invite you to browse to this page and verify results if you have any concerns about Conficker infections.

Kali Systems LLC considers these events to be worthy of serious notice, and is taking the additional step of notifying our customers so that they may be aware of these situations as they arise. We do not send these advisories frivolously and will only generate alerts if there is a compelling need for prompt attention at the user level. If you prefer not to receive these notices in the future - please let us know by email or phone, and we will not send further alerts.
